

Akvat Noise Generator

Documentation

Overview

The `Akvat Noise Generator` is a custom Unity Editor window that allows you to generate noise textures with various settings. This tool is ideal for creating procedural textures with adjustable parameters and multiple layers.

Using the Noise Generator Window

Settings

1. Texture Size:

- **Square Texture:** Toggle this option to make the texture square. If enabled, the width and height will be the same.
- **Texture Width & Height:** If the texture is not square, you can set the width and height separately.

2. Colors:

- **Primary Color:** The main color applied to the texture.
- **Secondary Color:** The secondary color used for blending with the primary color.

3. Noise Layers:

- **Layer Controls:** Add, remove, and reorder noise layers using the reorderable list.
- **Noise Type:** Select the type of noise (e.g., Perlin).
- **Scale:** Adjust the scale of the noise for each layer.
- **Intensity:** Set the intensity of the noise effect for each layer.

4. Generate Noise:

- Click the `Generate Noise` button to create a noise texture based on the current settings. The texture will be saved in `Assets/Akvat Games/Noise Generator/Generated Textures`.

5. Remove All Noise Layers:

- Click the `Remove All Noise Layers` button to clear all noise layers from the list.

Deleting Generated Textures

- To delete all previously generated textures, go to `Tools` -> `Akvat Games` -> `Noise Generator` -> `Delete Generated Textures`. This will remove all files from the `Generated Textures` folder.

Important Notes

- Texture Resolution: The resolution of the generated texture is based on the width and height settings. Ensure your settings are within acceptable ranges for your project needs.
